

Call for proposals to EMHSeed:
Seeding innovative research partnerships between
Engineering, Medicine, and the TAHSN¹ Research Institutes

The **EMHSeed** program is welcoming proposals for new collaborative projects beginning as early as January 2019. Each project will bring together an Engineering coPI and a Medicine/Hospital coPI. A basic requirement for each coPI is that each be appointed such that they can hold, as PI, grants such as NSERC or CIHR.

Additional EMHSeed projects may be funded if they align directly with the research goals of the [Ted Rogers Centre for Heart Research Translational Biology & Engineering Program](#) (TBEP) or the CFREF [Medicine by Design](#) (MbD). In the case of MbD, special consideration will be given to proposals that feature one or more of “synthetic biology”, “computational modeling” or “emergent phenomena” or are led by a clinician.

Background. EMHSeed is motivated by the recognition that UofT has one of the world’s leading Engineering faculties, and UofT/Toronto have world-class basic, pre-clinical, and clinical research in its Faculty of Medicine and its hospitals. There exists an urgent need – and for UofT and its affiliated hospitals, the remarkable opportunity – to develop innovative tools to advance the health sciences. Examples include:

- Molecular methods to aid in the rapid and specific diagnosis of disease based on nucleic acids, proteins, and small molecules found in the bloodstream. (*Example areas of interest include biomarkers, stem cell biology, nanotechnology, microfluidics, cell signaling, microfabrication, integrated circuit design, molecular synthesis, signal processing*);
- The systematic search for, and discovery of, novel genetic targets for advanced molecular therapies. (*Example areas of interest include: genomic and proteomic analysis, machine learning, artificial intelligence, management of large data sets, software architecture, heterogeneous computing.*)
- Materials, devices, and systems to aid in rehabilitative medicine, such as by forming machine: patient sensing and stimulus feedback loops. (*Example areas of interest include: neuroengineering, biomechanics, intelligent prostheses, electrical and biochemical sensing, systems control, signal processing, systems engineering.*)

EMHSeed develops a grassroots mechanism wherein a pair of coPIs from Engineering and Medicine/a Hospital Research Institute build a high-impact project that, in 2 years, generates results to enable applications for large-scale research funding.

PI Eligibility:

- 1) Each coPI should be eligible to hold, as PI, tri-council agency grants (NSERC or CIHR).
- 2) One PI should have a primary appointment with an Engineering unit, and one PI should have a primary appointment at the Faculty of Medicine.
- 3) Priority will be given to research teams that include at least one coPI in her/his first 10 years as a faculty member.

Application:

- (1) **A new opportunity.** Typically, PIs will not previously have collaborated – EMHSeed seeks to attract new researchers that have not previously partnered across engineering-medicine domains.
- (2) **A clear overarching goal.** The project should have a clear end goal, such as a key finding, a compelling prototype, or a persuasive data set that paves the way for larger funded projects.
- (3) **Excellence in research.** The researchers should provide evidence of established or emerging leadership in their area(s); and should show how their expertise will compellingly be united to solve an important, unsolved, problem at the engineering-medicine interface.
- (4) **A clear plan on collaboration.** Successful applications should demonstrate how graduate students work together, and how goals and milestones for the students will ensure meaningful partnership. The graduate students will be jointly advised by the coPIs and will work together on an interdisciplinary project focusing on an important

¹ Toronto Academic Health Sciences Network.

problem whose solution will unlock a large partnership or innovation opportunity. The proposal should also show how research planning, use of space, use of infrastructure, and supervision would all be shared and harmonized across the collaborating teams.

- (5) **A gateway to a major funded partnership.** Winning proposals will demonstrate that the EMHSeed support paves the way to major externally sponsored research. For example, the coPIs can show how the anticipated results of the project will provide the basis of at least 3 grant applications, to be submitted before the 2nd year anniversary of their EMHSeed project start, to agencies such as Genome Canada, ORF-Research Excellence, CIHR Team Grant, CIHR Project Scheme, CIHR POP, NSERC-CIHR CHRP (Collaborative Health Research Project), NIH technology development grants. coPIs should specify the dates of competitions they intend to apply to.
- (6) **Compelling annual milestones.** The project will offer compelling milestones that are the basis for renewal for a 2nd year and, if exceptional performance / stretch goals are met.

Budget:

The budget for each EMHSeed project will be \$60,000 CAD/year for 2 years. In exceptional cases, a no-cost extension for an additional year will be considered. The \$60,000 CAD/year amount for each project is the sum of total cash invested by each of the participating Faculties and departments/institutes, according to the following breakdown:

- **\$15k CAD/year from the Faculty of Applied Science and Engineering** (this will be committed following a positive decision from the EMHSeed adjudication process)
- **\$15k CAD/year from the Faculty of Medicine** (this will be committed following a positive decision from the EMHSeed adjudication process)
- **\$15k CAD/year from a Department or Institute within Engineering.** This must be committed via a letter from the Department Chair/Institute Director attached to the EMHSeed application.
- **\$15k CAD/year from a Faculty of Medicine or Academic Department or TAHSN Research Institute.** An analogous commitment letter must be attached to the EMHSeed application.

Notes:

- 1) The above-mentioned contributions are cash contributions, i.e. the contributors must all explicitly agree to transfer the funds in support of the project into the PI account.
- 2) The department contributions can be conditioned on success in the EMHSeed process.
- 3) Additional in-kind support, on top of and beyond the cash contributions may also be expressed in the letters and will be taken into consideration in the adjudication process.
- 4) Receipt of funding for the second year is contingent upon on a satisfactory progress report. A final report will be due at the end of the second year of the project.
- 5) In the case of projects co-funded by TBEP or MbD, the cash support from the Faculty of Medicine and the Faculty of Applied Science and Engineering could be partially replaced by the cash contribution provided by TBEP or MbD.

Use of funds. EMHSeed will prioritize the use of funds to support the stipend and research expenses of two collaborating graduate students, one earning a graduate degree in an Engineering unit, the other in a Medicine/Hospital unit. The graduate students will join together on a project at the engineering-health sciences interface. They will be jointly advised by the coPIs and will work on an important problem whose solution will unlock a large partnership or innovation opportunity.

Submission process. Applications including all supporting documentation are due by email to vdr@ecf.utoronto.ca by close of business **November 27, 2018**. Please include the term EMHSeed in the subject line. Submissions should include 1) completed application form (attached), 2) letters of support confirming cash contributions from each of the collaborating departments/hospital, 3) CVs of co-PI (e.g. CCV or NSERC Form 100).

Adjudication process. An adjudication committee composed of representatives from Partner Divisions will review proposals received by the submission deadline against program criteria. Decisions will be reported by mid-December 2018 against program criteria.
